

Software Testing Project Proposal: SauceDemo Application

Student Name: Tufan Şahin Düzel

Student ID: 1002729

Student Mail: tufansahinduzel@ibu.edu.mk

Course: Software Quality and Testing

1. Introduction In this project, I will test a web application called "SauceDemo" (Swag Labs). It is an e-commerce platform that allows users to log in, add products to a cart, and complete an order. My main goal is to make sure the website is reliable, functional, and easy to use for customers.

2. Scope of Work I plan to test the most important parts of the website to find any possible bugs. The testing will cover:

- **User Login:** Checking if valid users can log in and if incorrect passwords show error messages.
- **Product Browsing:** Ensuring that items are displayed correctly with their prices.
- **Cart Functionality:** Adding and removing items from the shopping cart.
- **Checkout Process:** Verifying that the checkout steps work perfectly until the order confirmation.

3. Testing Strategy I will use the **Black-Box Testing** method for this project. This means I will focus on the inputs and outputs of the website without looking at the internal code. I will follow the **Software Testing Life Cycle (STLC)** stages, starting from requirement analysis to final reporting.

4. Tools and Technologies To make the testing process more effective, I will use these tools:

- **Manual Testing:** I will use Microsoft Excel to write and track my test cases.
- **Automation:** I plan to use **Selenium with Java (JUnit)** to automate repetitive tests like the login process.
- **Bug Tracking:** I will document every defect I find, including its severity and steps to reproduce.

5. Deliverables At the end of the project, I will submit:

- A professional **Test Plan** document.
- A **Test Case Suite** with detailed steps.
- A **Bug Report** for the identified issues.
- A **Final Report** summarizing the results.
